

# Quick-Start Protocol

November 2022

# QIAcuity<sup>®</sup> HEK293 resDNA Quant Standard

QIAcuity HEK293 resDNA Quant Standard consists of QIAcuity HEK293 resDNA Quant Standard DNA and Rehydration Buffer. The QIAcuity HEK293 resDNA Quant Standard DNA is a dPCR-verified absolute quantification standard that can be used in combination with the QIAcuity HEK293 resDNA Quant Kit (Cat. No. 250224) for validation of quantitation accuracy or bridging studies. The kit is shipped on dry ice and should be stored at -30 to  $-15^{\circ}$ C in a constant-temperature freezer upon receipt. Under these conditions the kit components are stable, without showing any reduction in performance and quality, until the expiry date indicated on the label.

### Kit content

| Component  | Quantity | Cap Color | Storage (°C) |
|--|----------|-----------|--------------|
| QIAcuity HEK293 resDNA Quant Standard (1000 pg)(lyophilized) | 1        | Blue      | -30 to -15   |
| Rehydration Buffer, 1.5 mL                                   | 1        | White     | -30 to -15   |

# Notes before starting

To maintain a working environment free of external DNA contamination, we recommend the following precautions for accurate and reproducible dPCR results:

- Wear lab coats, goggles, and gloves throughout the procedure.
- Decontaminate your dPCR workspace and labware (pipets, tube racks, etc.) before each new experiment to render any DNA contamination ineffective in dPCR.
- Store template materials and positive and negative controls separately from other reagents. Physically separate dPCR setup workspaces from post-dPCR processing operations.
- Use fresh QIAcuity nanoplates and PCR-grade labware. Use sterile filter-tip pipettes.

- Do not remove the sealer foil from previously used QIAcuity nanoplates that releases dPCR product DNA into the air and contaminate results.
- Do not remove the QIAcuity nanoplate from its protective sealed bag until immediately before use.
- Pipetting accuracy and precision affect the consistency of results. Also make sure that no bubbles are introduced into the wells of the QIAcuity nanoplate during pipetting.
- At least one No Template Control (NTC) sample should be included in the runs to detect any external DNA contamination.
- DNA samples with ≥20 kb average length should be fragmented by restriction digestion before partitioning. Enzymatic fragmentation of larger DNA ensures even distribution of template throughout the QIAcuity nanoplate, which in turn leads to accurate and precise quantification.
- The following validated enzymes will not cut within the amplified sequence. It is sufficient to digest DNA templates in 10 min at room temperature (15–25°C) when added directly to the reaction mix at the indicated concentrations.

#### Validated restriction enzymes

| o-cutter restriction enzymes |   |       |                               |
|------------------------------|---|-------|-------------------------------|
| <i>Eco</i> RI                | 0.25 U/µL EcoRI-HF®, NEB®                                 | Pvull | 0.025 U/µL Pvull, NEB         |
|                              | 0.025 U/µL Anza™ 11 EcoRI, Thermo Fisher Scientific (TFS) |       | 0.025 U/µL Anza 52 Pvull, TFS |
|                              |   | Xbal  | 0.025 U/µL Anza 12 Xbal, TFS  |

# Procedure

#### Rehydration of the reagents

Add 100  $\mu$ L Rehydration Buffer to the QIAcuity HEK293 resDNA Quant Standard to produce a final concentration of 10 pg/ $\mu$ L. Vortex and spin briefly after reconstitution. Afterwards, incubate for 20 min at 37°C.

#### **Reaction setup**

 Thaw QIAcuity HEK293 resDNA Quant Standard Kit and QIAcuity HEK293 resDNA Quant Kit components: HEK293 resDNA Quant Master Mix (2x), internal control and dPCR qualified water. Vigorously mix the HEK293 resDNA Quant Master Mix, HEK293 resDNA Quant Standard and the individual solutions. Centrifuge briefly to collect liquids at the bottom of the tubes. The table below provides exemplary loading amounts and dilutions for HEK293 resDNA Quant Standard DNA.

| QIAcuity HEK293 resDNA Quant Standard<br>Volume* (10 pg/µL) in 40 µL reaction | Final amount in 40 µL reaction<br>(pg) | Final concentration in 40 µL reaction<br>(pg/µL) |
|---|--|--|
| 18 µL   | 180                                    | 4.5  |
| 10 µL   | 100                                    | 2.5  |
| 4 µL  | 40                                     | 1  |
| 2 μL  | 20                                     | 0.5  |
| 0.4 µL  | 4                                      | 0.1  |
| 0.2 µL  | 2                                      | 0.05   |

\* After rehydration.

2. Prepare a reaction mix for the number of reactions needed according to the table hereafter. Due to hot-start, it is not necessary to keep samples on ice during reaction setup or while programming the QIAcuity instrument. The stringency of hot-start, along with other proprietary chemical components in HEK293 resDNA Quant Master Mix (2x) is essential for delivering highest performance in residual DNA quantification.

| Component  | Reagent/sample volume<br>Nanoplate 26k (24-well) | Final concentration   |
|--|--|-----------------------|
| QIAcuity HEK293 resDNA Quant Master Mix (2x)       | 20 µL  | lx                    |
| QIAcuity HEK293 resDNA Quant Internal Control      | 1 µL (recommended)                               | 100 ± 20 copies/ µL * |
| dPCR Qualified Water                               | Variable   | -                     |
| QIAcuity HEK293 resDNA Quant Standard <sup>†</sup> | Variable   | -                     |
| Restriction enzyme                                 | Up to 1 µL                                       | 0.025–0.25 U/ µL      |
| Total reaction volume                              | 40 µL  | -                     |

\* Expected dPCR result when 1 µL of internal control is added to the 40 µL reaction. It is recommended for maximal precision to add the internal control directly in the master mix.

<sup>†</sup> QIAcuity HEK293 resDNA Quant Standard loading amounts may vary according to the experimental setup and should not exceed 50 pg per reaction.

- 3. Vortex gently and spin down the reaction mix. Dispense appropriate volumes of the reaction mix into the wells of a standard PCR plate. Then, add template DNA into each well that contains the reaction mix. Make sure all components are mixed well. Centrifuge briefly.
- 4. Transfer the content of each well from the standard PCR plate to the wells of the nanoplate avoiding air bubbles.
- 5. Seal the nanoplate properly using the QIAcuity Nanoplate Seal provided in the QIAcuity Nanoplate Kits.

Note: For exact sealing procedure, please see the QIAcuity User Manual.

6. Leave the plate for 10 min at room temperature for restriction digestion of Standard DNA.

#### Thermal cycling conditions

1. Program the cycler of the QIAcuity instrument according to the following table:

| Step                         | Time  | Temperature (°C) |
|------------------------------|-------|------------------|
| PCR initial heat activation  | 2 min | 95               |
| Two-step cycling (5 cycles)  |       |                  |
| Denaturation                 | 15 s  | 95               |
| Combined annealing/extension | 30 s  | 60               |
| Two-step cycling (40 cycles) |       |                  |
| Denaturation                 | 15 s  | 95               |
| Combined annealing/extension | 30 s  | 66               |

2. Adjust the QIAcuity instrument according to the recommended Imaging settings:

| Target                | Detection Channel | Exposure/Gain |
|-----------------------|-------------------|---------------|
| Target assay (HEK293) | Green             | 500/6         |
| Internal Control      | Yellow            | 500/6         |

3. Place the nanoplate into the QIAcuity instrument and start the dPCR program.

Note: For details, please see the QIAcuity User Manual.

#### Analysis

Use absolute quantification in QIAcuity Software Suite to calculate the target HEK293 DNA concentration in the reaction in copies/ $\mu$ L. Use following table for exemplary calculations for converting HEK293 DNA concentration from copies/ $\mu$ L to fg/ $\mu$ L.

| Kit                              | Target copy number | Amplicon size | Conversion factor<br>(copies/µL to fg/µL) |
|----------------------------------|--------------------|---------------|---|
| QIAcuity HEK293 resDNA Quant Kit | Approx. 1,000,000  | <100 bp       | 1.54                                      |

| HEK293 DNA concentration (copies/µL) | HEK293 DNA concentration (fg/µL) |
|--------------------------------------|----------------------------------|
| 10                                   | 15.4                             |
| 20                                   | 30.8                             |
| 100                                  | 154                              |
| 200                                  | 308                              |
| 650                                  | 1000                             |
| 1000                                 | 1540                             |

#### **Document Revision History**

| Date    | Changes         |  |
|---------|-----------------|--|
| 11/2022 | Initial release |  |
