PAXgene®

Blood RNA Kit Handbook

Version 2

PreAnalytiX GmbH,
Feldbachstrasse, CH-8634 Hombrechtikon
Produced by QIAGEN GmbH for PreAnalytiX
Limited License Agreement

Use of this product signifies the agreement of any purchaser or user of the PAXgene Blood RNA Kit to the following terms:

1. The PAXgene Blood RNA Kit may be used solely in accordance with the PAXgene Blood RNA Kit Handbook and for use with components contained in the Kit only. PreAnalytiX grants no license under any of its intellectual property to use or incorporate the enclosed components of this Kit with any components not included within this Kit except as described in the PAXgene Blood RNA Kit Handbook and additional protocols available at www.preanalytix.com.

2. Other than expressly stated licenses, PreAnalytiX makes no warranty that this Kit and/or its use(s) do not infringe the rights of third-parties.

3. This Kit and its components are licensed for one-time use and may not be reused, refurbished, or resold.

4. PreAnalytiX specifically disclaims any other licenses, expressed or implied other than those expressly stated.

5. The purchaser and user of the Kit agree not to take or permit anyone else to take any steps that could lead to or facilitate any acts prohibited above.

6. PreAnalytiX may enforce the prohibitions of this Limited License Agreement in any Court, and shall recover all its investigative and Court costs, including attorney fees, in any action to enforce this Limited License Agreement or any of its intellectual property rights relating to the Kit and/or its components.

For updated license terms, see www.preanalytix.com.

Conditional Sale

The present product comes with a license under certain claims of US-7,270,953, and US-7,682,790, as well as EP-1820793 B1 and foreign equivalents of these patent claims to use the product to process the nucleic acid complex formed in the course of sample collection in a PAXgene Blood RNA Tube.

* Not compatible with disinfecting reagents containing bleach. Contains a guanidine salt. See page 7 for safety information.

† Buffer BR4 is supplied as a concentrate. Before using for the first time, add 4 volumes of ethanol (96–100%, purity grade p.a.) as indicated on the bottle to obtain a working solution.

‡ Kunitz units are the commonly used units for measuring DNase I, defined as the amount of DNase I that causes an increase in A260 of 0.001 per minute per milliliter at 25°C, pH 5.0, with highly polymerized DNA as the substrate (Kunitz, M. (1950) J. Gen. Physiol. 33, 349 and 363).

Storage conditions

PAXgene RNA spin columns, PAXgene Shredder spin columns, proteinase K, and Buffers BR1 to BR5 can be stored dry at the temperature indicated on the kit label.

The RNase-Free DNase Set, which contains DNase I, Buffer RDD and RNase-free water (tube), is shipped at ambient temperature. Store all components of the RNase-Free DNase Set immediately upon receipt at the temperature indicated on the label. When stored properly, the kit is stable until the expiration date on the kit box.

Intended Use

The PAXgene Blood RNA Kit is for the purification of intracellular RNA from whole blood collected in the PAXgene Blood RNA Tube. When the kit is used in conjunction with the PAXgene Blood RNA Tube, the system provides purified intracellular RNA from whole blood for RT-PCR used in molecular diagnostic testing. See the PAXgene Blood RNA Tube Product Circular for information about the use of PAXgene Blood RNA Tubes.

Performance characteristics for the PAXgene Blood RNA System have only been established with FOS and IL1B gene transcripts. The user is responsible for establishing appropriate PAXgene Blood RNA System performance characteristics for other target transcripts.

Product Use Limitations

The PAXgene Blood RNA Kit is intended for purification of intracellular RNA from human whole blood (4.8 x 10^6 – 1.1 x 10^7 leukocytes/ml) for in vitro diagnostics applications. It is not for the purification of genomic DNA or viral nucleic acids from human whole blood. Due to the limited number of transcripts validated for stabilization specifications (FOS and IL1B gene transcripts), the performance characteristics have not been established for all transcripts. Laboratory personnel should review the manufacturer’s data and their own data to determine whether validation is necessary for other transcripts.

Quality Control

In accordance with QIAGEN’s ISO-certified Quality Management System, each lot of PAXgene Blood RNA Kit is tested against predetermined specifications to ensure consistent product quality.
Technical Assistance

At QIAGEN we pride ourselves on the quality and availability of our technical support. Our Technical Service Departments are staffed by experienced scientists with extensive practical and theoretical expertise in molecular biology and the use of PreAnalytiX products. If you have any questions regarding the PAXgene Blood RNA Kit, please do not hesitate to contact us.

For technical assistance and more information please call QIAGEN Technical Services (see page 63).

Safety Information

When working with chemicals, always wear a suitable lab coat, disposable gloves, and protective goggles.

To avoid the risk of infection (e.g., from HIV or hepatitis B viruses) or injury when working with biological and chemical materials, always wear a suitable lab coat, disposable gloves, and protective goggles. For more information, please consult the appropriate safety data sheets (SDSs). These are available online in convenient and compact PDF format at www.preanalytix.com/resources where you can find, view, and print the SDSs for this kit.

**CAUTION: DO NOT add bleach or acidic solutions directly to the sample-preparation waste.**

Buffers BR2 and BR3 contain guanidine thiocyanate, which can form highly reactive compounds when combined with bleach. If Buffer BR2 or BR3 are spilt, clean with suitable laboratory detergent and water. If liquid containing potentially infectious agents is spilt, clean the affected area first with laboratory detergent and water, and then with 1% (v/v) sodium hypochlorite.

The RNA stabilizing solution and blood mixture from the PAXgene Blood RNA Tube can be disinfected using 1 volume of commercial bleach solution (5% sodium hypochlorite) per 9 volumes of the RNA stabilizing solution and blood mixture.

Sample-preparation waste, such as supernatants from centrifugation steps in the RNA purification procedure, is to be considered potentially infectious. Before disposal, the waste must be autoclaved or incinerated to destroy any infectious material. Disposal must be made according to official regulations.
The following hazard and precautionary statements apply to components of the PAXgene Blood RNA Kit. See the PAXgene Blood RNA Tube Product Circular for safety information about PAXgene Blood RNA Tubes.

**Buffer BR2**

Contains: guanidine thiocyanate. Danger! Harmful if swallowed. May be harmful in contact with skin or if inhaled. Causes severe skin burns and eye damage. Harmful to aquatic life with long lasting effects. Contact with acids liberates very toxic gas. Dispose of contents/container to an approved waste disposal plant. IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. IF ON SKIN (or hair): Remove/Take off immediately all contaminated clothing. Rinse skin with water/shower. Immediately call a POISON CENTER or doctor/physician. Store locked up. Wear protective gloves/protective clothing/eye protection/face protection.

**Buffer BR3**

Contains: ethanol; guanidine thiocyanate. Danger! Causes severe skin burns and eye damage. Flammable liquid and vapor. Contact with acids liberates very toxic gas. Dispose of contents/container to an approved waste disposal plant. IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. IF ON SKIN (or hair): Remove/Take off immediately all contaminated clothing. Rinse skin with water/shower. Immediately call a POISON CENTER or doctor/physician. Keep away from heat/sparks/open flames/hot surfaces. – No smoking. Store in a well-ventilated place. Keep cool. Wear protective gloves/protective clothing/eye protection/face protection.
DNase I

Contains: Desoxyribonuclease. Danger! May cause an allergic skin reaction. May cause allergy or asthma symptoms or breathing difficulties if inhaled. Avoid breathing dust/fume/gas/mist/vapors/spray. Dispose of contents/container to an approved waste disposal plant. If experiencing respiratory symptoms: Call a POISON CENTER or doctor/physician. IF INHALED: If breathing is difficult, remove victim to fresh air and keep at rest in a position comfortable for breathing. Take off contaminated clothing and wash it before reuse. Wear protective gloves/protective clothing/eye protection/face protection. Wear respiratory protection.

Proteinase K

Contains: Proteinase K. Danger! Causes mild skin irritation. May cause allergy or asthma symptoms or breathing difficulties if inhaled. Avoid breathing dust/ fume/ gas/ mist/ vapors/ spray. Dispose of contents/container to an approved waste disposal plant. If experiencing respiratory symptoms: Call a POISON CENTER or doctor/physician. IF INHALED: If breathing is difficult, remove victim to fresh air and keep at rest in a position comfortable for breathing. Wear respiratory protection.
Introduction

Collection of whole blood is the first step in many molecular assays used to study cellular RNA. However, a major problem in such experiments is the instability of the cellular RNA profile in vitro. Studies at PreAnalytiX have shown that the copy numbers of individual mRNA species in whole blood can change more than 1000-fold during storage or transport at room temperature.* This is caused both by rapid RNA degradation and by induced expression of certain genes after the blood is drawn. Such changes in the RNA expression profile make reliable studies of gene expression impossible. A method that preserves the RNA expression profile during and after phlebotomy is therefore essential for accurate analysis of gene expression in human whole blood.

Principle and procedure

PreAnalytiX has developed a new system that enables the collection, stabilization, storage, and transportation of human whole blood specimens, together with a rapid and efficient protocol for purification of intracellular RNA. The system requires the use of PAXgene Blood RNA Tubes (US Patents 6,602,718 and 6,617,170) for blood collection and RNA stabilization, followed by manual or automated RNA purification using the PAXgene Blood RNA Kit. Both manual and automated protocols provide substantially equivalent performance with regards to RNA quality and yield. Performance data for the manual protocol (page 16) and the automated protocol (page 25) are included in this handbook.

Sample collection and stabilization

PAXgene Blood RNA Tubes contain a proprietary reagent composition based on a patented RNA stabilization technology. This reagent composition protects RNA molecules from degradation by RNases and minimizes ex vivo changes in gene expression. PAXgene Blood RNA Tubes are intended for the collection of human whole blood and stabilization of cellular RNA for up to 3 days at 18–25°C (Figure 1, page 12) or up to 5 days at 2–8°C (Figure 2, page 13). Currently available data shows stabilization of cellular RNA for at least 8 years at –20°C or –70°C†. For more information from ongoing studies evaluating stability for longer time periods, please contact QIAGEN Technical Services.

† A long-term study of blood storage in PAXgene Blood RNA Tubes is ongoing.
The actual duration of RNA stabilization may vary depending upon the species of cellular RNA and the downstream application used. Due to the limited number of transcripts validated for stabilization specifications (FOS and IL1B gene transcripts), the performance characteristics have not been established for all transcripts. Laboratory personnel should review the manufacturer’s data and their own data to determine whether validation is necessary for other transcripts.
Figure 1. RNA stability in blood samples at 18–25°C. Blood was drawn from 10 donors, with duplicate samples and stored at 18–25°C for the indicated number of days, followed by total RNA purification. Blood was collected and stored in PAXgene Blood RNA Tubes, and total RNA was purified using the PAXgene Blood RNA Kit. A FOS and B IL1B were determined by real-time, duplex RT-PCR, using 18S rRNA as an internal standard. The values for all samples are plotted (20 data sets for each gene, blue lines), with means (red lines) and standard deviations (black bars) of all samples shown. The dashed lines indicate the ±3x total precision of the assay (FOS: 2.34 Ct; IL1B: 1.93 Ct).
Figure 2. RNA stability in blood samples at 2–8°C. Blood was drawn and total RNA purified, after storage at 2–8°C, as described in Figure 1. Relative transcript levels of A FOS and B IL1B were determined by real-time, duplex RT-PCR, using 18S rRNA as an internal standard. The values for all samples are plotted (20 data sets for each gene, blue lines), with means (red lines) and standard deviation (black bars) of all samples shown. The dashed lines indicate the ±3x total precision of the assay (FOS: 2.34 C_T; IL1B: 1.93 C_T).
RNA concentration and purification

The PAXgene Blood RNA Kit is for the purification of total RNA from 2.5 ml human whole blood collected in a PAXgene Blood RNA Tube. The procedure is simple and can be performed using manual or automated procedures (see flowchart). In both protocols, purification begins with a centrifugation step to pellet nucleic acids in the PAXgene Blood RNA Tube. The pellet is washed and resuspended, followed by manual or automated RNA purification. In principle, both protocols follow the same protocol steps with the same kit components.

The Manual PAXgene Blood RNA Procedure
The Automated PAXgene Blood RNA Procedure

1. Add protease K and binding buffer, incubate
2. Transfer to PAXgene Blood spin column
3. Add ethanol to flow-through
4. Load on PAXgene RNA Spin Column, bind total RNA
5. Wash
6. Enzyme-digest RNA
7. Wash
8. Elute
   - Close lid of microcentrifuge tube and transfer to QIAcube shaker
   - Heat to 65°C
9. Resuspend
10. Transfer PAXgene RNA Spin Column
11. Wash pellet
12. Ready to use RNA
**Manual RNA purification**

In detail, the resuspended pellet is incubated in optimized buffers together with proteinase K to bring about protein digestion. An additional centrifugation through the PAXgene Shredder spin column is carried out to homogenize the cell lysate and remove residual cell debris, and the supernatant of the flow-through fraction is transferred to a fresh microcentrifuge tube. Ethanol is added to adjust binding conditions, and the lysate is applied to a PAXgene RNA spin column. During a brief centrifugation, RNA is selectively bound to the PAXgene silica membrane as contaminants pass through. Remaining contaminants are removed in several efficient wash steps. Between the first and second wash steps, the membrane is treated with DNase I to remove trace amounts of bound DNA. After the wash steps, RNA is eluted in elution buffer (Buffer BR5) and heat-denatured.

Total RNA purified using the PAXgene Blood RNA System is highly pure. Using the manual protocol, $A_{260}/A_{280}$ values are between 1.8 and 2.2, and ≤1% (w/w) genomic DNA is present in ≥95% of all samples, as measured by quantitative, real-time PCR of a sequence of the beta-actin gene. At least 95% of samples show no inhibition in RT-PCR, when using up to 30% of the eluate.

Using the manual protocol, average sample preparation time (based on data from 12 sample preps) is approximately 90 minutes, with only 40 minutes of hands-on time. RNA yields from 2.5 ml healthy human whole blood are ≥3 µg for ≥95% of the samples processed. Since yields are highly donor-dependent, individual yields may vary. For individual donors, the PAXgene Blood RNA system provides highly reproducible and repeatable yields (Figures 3 and 4, pages 17 and 18) and reproducible and repeatable RT-PCR (Figures 5 and 6, pages 22 and 23), making it highly robust for clinical diagnostic tests.

Figure 3 (page 17) indicates the overall repeatability and reproducibility of the PAXgene Blood RNA System. Additional studies were conducted to show the influence of different PAXgene Blood RNA kit lots and different operators on the reproducibility of RNA yield and real time RT-PCR performance. As pooled blood samples instead of individual PAXgene Blood RNA Tubes were used for these studies, the results do not reflect the system repeatability, including fluctuation between individual blood draws, but only the repeatability of the sample preparation (see Figure 4, page 18).
Figure 3. Reproducible and repeatable RNA purification. Quadruplicate blood samples from 14 donors were manually processed by each of 3 technicians (A, B, C). Three sets of equipment were used, and all samples prepared by a single technician were processed using the same equipment. A Means and standard deviations of RNA yield per replicate samples from the same donors and different technicians are shown. B Twelve replicate blood samples from each of 14 donors were processed by the 3 different technicians. Means and standard deviations of RNA yield per samples from the same donors and all technicians are presented. For all RNA samples, $A_{260}/A_{280}$ ratios ranged from 1.8 to 2.2.
Figure 4. Repeatability and reproducibility of RNA yield for different operators and PAXgene Blood RNA Kit lots using pooled blood samples. Blood samples from 30 different donors were collected in PAXgene Blood RNA Tubes (12 tubes per donor, 360 tubes in total). The contents of the tubes from 3 donors were pooled and subsequently realiquoted into 36 samples. These 36 samples per 3-donor-pool were manually processed by 3 different operators. Each operator used 3 different PAXgene Blood RNA Kit lots for the extraction and processed quadruplicate samples from each of the 10 donor pools. **A** RNA yield and standard deviation for every operator–lot combination. Quadruplicate blood samples from 10 donor pools were processed by 3 different operators (A, B, C) with each of 3 kit lots (1, 2, 3). The mean yields (columns) and standard deviations (error bars) per quadruplicate sample from the same donor pool for different operator and different kit lot are presented. **B** CV of RNA yield per donor pool for all operator–lot combinations (A, B, C; 1, 2, 3) as calculated from the mean yield and standard deviation of the yield shown in Figure 4A.

Detailed analysis of 4 representative donor pools. The pools were selected according to the white blood cell count and reflect the upper, medium, and the lower values of the normal range of white blood cell counts (4.8 x 10^6 – 1.1 x 10^7 leukocytes/ml). The white blood cell count represents the mean value of the 3 white blood cell counts from the 3 donors per donor pool.
Figure 5. Reproducibility of RT-PCR — between users. RNA purified in the experiment described in Figure 4 was used for real-time RT-PCR. Relative transcript levels of $\text{A} \ FOS$ and $\text{B} \ IL1B$ were determined by real-time, duplex RT-PCR using 18S rRNA as an internal standard. The values for all samples are plotted, relative to the values for user 1 (10 donor pools x 3 kit lots x 4 replicates = 120 data sets for each gene), with means (red lines) and standard deviations (black bars) for all samples shown. The dashed lines indicate the $\pm 3x$ total precision of the assays ($\text{FOS: 2.34 C}_{\text{T}}$; $\text{IL1B, 1.93 C}_{\text{T}}$).
Figure 6. Reproducibility of RT-PCR — between kit lots. RNA purified in the experiment described in Figure 4 was used for real-time RT-PCR. Relative transcript levels of A) FOS and B) IL1B were determined by real-time, duplex RT-PCR using 18S rRNA as an internal standard. The values for all samples are plotted, relative to the values for kit lot 1 (10 donor pools x 3 users x 4 replicates = 120 data sets for each gene), with means (red lines) and standard deviations (black bars) for all samples shown. The dashed lines indicate the ±3x total precision of the assays (FOS: 2.34 C\text{_{T}}; IL1B, 1.93 C\text{_{T}}).

Automated RNA purification

Sample preparation using the QIAcube® follows the same steps as the manual procedure, enabling you to continue using the PAXgene Blood RNA Kit for purification of high-quality RNA. See the QIAcube User Manual and www.qiagen.com/MyQIAcube for more information about the QIAcube.

The centrifuged, washed, and resuspended nucleic acid pellet (see “RNA concentration and purification”, page 14) is transferred from the PAXgene Blood RNA Tube into processing tubes, which are placed into the thermoshaker unit on the QIAcube worktable. The operator selects and starts the “PAXgene Blood RNA Part A” protocol from the menu. The QIAcube performs the steps of the protocol through to elution of RNA in elution buffer. The operator transfers the microcentrifuge tubes, containing the purified RNA, into the thermoshaker unit of the QIAcube. The operator selects and starts the “PAXgene Blood RNA Part B” protocol from the menu, and heat denaturation is performed by the QIAcube.

Average sample preparation time (based on data from 12 sample preps) is 125 minutes, with only approximately 20 minutes of hands-on time.

RNA yields from 2.5 ml healthy human whole blood are ≥3 µg for ≥95% of the samples processed. Figure 7 (page 26) indicates the RNA yields from a total of 288 samples prepared using the automated protocol with 3 kit lots by 3 operators. As pooled blood samples instead of individual PAXgene Blood RNA Tubes were used for these studies, the results do not reflect the RNA yield expected from single samples of individual blood draws. Since yields are highly donor-dependent, individual yields may vary (Figure 7, page 26).
Figure 7. RNA yield — automated processing. Blood samples from 48 different donors were collected in PAXgene Blood RNA Tubes (6 tubes per donor, 288 tubes in total). The contents of the tubes from 6 donors were pooled and subsequently realiquoted into 36 samples. These 36 samples per 6-donor-pool were processed by 3 different operators (A, B, C). Each operator used 3 different lots (1, 2, 3) of the PAXgene Blood RNA Kit for automated extraction and processed quadruplicate samples from each of the 8 donor pools. RNA yields of all individual samples are shown for every operator–lot combination.

At least 95% of samples show no inhibition in RT-PCR, when using up to 30% of the eluate.

RNA purified with the PAXgene Blood RNA System and the automated protocol is highly pure, as shown by lack of RT-PCR inhibition (see above) and \( \frac{A_{260}}{A_{280}} \) values between 1.8 and 2.2. Genomic DNA is present at \( \leq 1\% \) (w/w) in \( \geq 95\% \) of all samples, as measured by quantitative, real-time PCR of a sequence of the beta-actin gene. Figures 8 and 9 (page 27) show the \( \frac{A_{260}}{A_{280}} \) values and relative genomic DNA of a total of 288 samples prepared using the automated protocol with 3 kit lots by 3 operators.
Figure 8. RNA purity ($A_{260}/A_{280}$ values) — automated processing. RNA was purified by 3 different operators (A, B, C) using 3 different lots (1, 2, 3) of the PAXgene Blood RNA Kit in the experiment described in Figure 7. $A_{260}/A_{280}$ values of all individual samples are shown for every operator–lot combination.

Figure 9. RNA purity (% genomic DNA contamination) — automated processing. RNA was purified by 3 different operators (A, B, C) using 3 different lots (1, 2, 3) of the PAXgene Blood RNA Kit in the experiment described in Figure 7. Genomic DNA amounts (w/w) in all individual samples are shown for every operator–lot combination.

The automated protocol of RNA purification using the PAXgene Blood RNA System provides highly reproducible and repeatable RT-PCR results, as shown in Figure 10 (page 28), making it highly robust for clinical diagnostic tests.
Figure 10. Reproducibility of RT-PCR — between automated and manual protocols.
RNA was purified by 3 different operators (A, B, C) using 3 different lots (1, 2, 3) of the PAXgene Blood RNA Kit using the automated protocol in the experiment described in Figure 7. In parallel, RNA was purified from the corresponding replicate tubes using the manual protocol. Relative transcript levels of \( \text{A} \) FOS and \( \text{B} \) IL1B were determined by real-time, duplex RT-PCR using 18S rRNA as an internal standard. Possible differences of transcript levels between RNA prepared from paired blood samples using both extraction protocols (automated and manual protocol) were calculated by the \( \Delta \Delta C_T \) method. Individual \( \Delta \Delta C_T \) values for all sample pairs (4 replicates x 8 donor pools x 3 kit lots x 3 operators = 288 pairs for each gene) are plotted as single dots with means (larger dots) and standard deviations (black bars) for all samples shown. The dashed lines indicate the ±3x total precision of the assays (FOS: 2.34 C_T; IL1B, 1.93 C_T).
Equipment and Reagents to Be Supplied by User

When working with chemicals, always wear a suitable lab coat, disposable gloves, and protective goggles. For more information, consult the appropriate safety data sheets (SDSs), available from the product supplier.

For all protocols
- PAXgene Blood RNA Tubes (cat. no. 762165)
- Ethanol (96–100%, purity grade p.a.)
- Pipets* (10 µl – 4 ml)
- Sterile, aerosol-barrier, RNase-free pipet tips†
- Graduated cylinder‡
- Centrifuge* capable of attaining 3000–5000 x g, and equipped with a swing-out rotor and buckets to hold PAXgene Blood RNA Tubes
- Vortex mixer*
- Crushed ice
- Permanent pen for labeling

For the manual protocol
- Variable-speed microcentrifuge* capable of attaining 1000–8000 x g, and equipped with a rotor for 2 ml microcentrifuge tubes
- Shaker–incubator* capable of incubating at 55°C and 65°C and shaking at ≥400 rpm, not exceeding 1400 rpm (e.g., Eppendorf® Thermomixer Compact, or equivalent)

* Ensure that instruments have been checked, maintained, and calibrated regularly according to the manufacturer’s recommendations.
† Ensure that you are familiar with the guidelines on handling RNA (Appendix A, page 55).
‡ For the addition of ethanol to Buffer BR4 concentrate.
For the automated protocol

- QIAcube* (QIAGEN, cat. no. 9001292 [110 V], cat. no. 9001293 [230 V])
- Scissors

QIAcube consumables

- Filter-Tips, 1000 µl (1024) (QIAGEN, cat. no. 990352)†
- Reagent Bottles, 30 ml (6) (QIAGEN, cat. no. 990393)†
- Rotor Adapters (10 x 24) (QIAGEN, cat. no. 990394)†

QIAcube accessories

- Reagent Bottle Rack (QIAGEN, cat. no. 990390)†
- Rotor Adapter Holder (QIAGEN, cat. no. 990392)†

* Ensure that instruments have been checked, maintained, and calibrated regularly according to the manufacturer’s recommendations.
† Also included in the Starter Pack, QIAcube (QIAGEN, cat. no. 990395).
Important Notes

Using the QIAcube

Ensure that you are familiar with operating the QIAcube. Please read the QIAcube User Manual and any additional information supplied with the QIAcube, paying careful attention to the safety information, before beginning the automated PAXgene Blood RNA protocols.

Starting the QIAcube

Close the QIAcube door, and switch on the QIAcube with the power switch (see Figure 11, page 32).

A beeper sounds and the startup screen appears. The instrument automatically performs initialization tests.

Installing protocols on the QIAcube

An initial protocol installation is required before the first RNA preparation run on the QIAcube can be performed. Install both “PAXgene Blood RNA Part A” and “PAXgene Blood RNA Part B” protocols.

Protocols are provided at www.qiagen.com/MyQIAcube and need to be downloaded to the USB stick supplied with the QIAcube and transferred to the QIAcube via the USB port.

The USB port, located behind the protective panel (see Figure 11, page 32), allows connection of the QIAcube to a USB stick (supplied with the QIAcube). Data files, such as log files or report files can also be transferred via the USB port from the QIAcube to the USB stick.

Note: The USB port is only for use with the USB stick provided by QIAGEN. Do not connect other devices to this port.

Note: Do not remove the USB stick while downloading protocols or transferring data files or during a protocol run.
Figure 11. Front view of the QIAcube.

2 Door
3 RS232 serial port behind protective panel (for use by QIAGEN Instrument Service Specialists only)
4 USB port behind protective panel
5 Power switch
6 Waster drawer

Loading the QIAcube

To save time, loading can be performed during one or both of the 10-minute centrifugation steps (steps 3 and 5) in “Protocol: Automated Purification of Total RNA from Human Whole Blood Collected into PAXgene Blood RNA Tubes”, page 47.
Reagent bottles

Carefully fill 4 QIAcube reagent bottles with the reagents listed in Table 3 (fill the bottles up to the indicator level on the reagent bottles). Label the bottles and lids clearly with buffer names and place them into the appropriate position in the reagent bottle rack (see Figure 12, page 34).

Before every run on the QIAcube, carefully fill the four reagent bottles listed in Table 3 up to the maximum indicator level or, if that is not possible, to the level allowed by the buffer volumes supplied in the PAXgene Blood RNA Kit. Label the bottles and lids clearly with the buffer names and place the filled reagent bottles into the appropriate positions on the reagent bottle rack. Load the rack onto the QIAcube worktable as shown (Figures 12 and 13, page 34).

Note: The supplied volume of Buffer BR2 will not fill a reagent bottle to the indicator level. Buffers BR3 and BR4 may not fill the bottle to the indicator level after processing multiple samples in previous runs.

Note: Be sure to remove lids from the bottles before placing onto the worktable.

Note: Buffer volumes provided in the PAXgene Blood RNA Kit (50) are sufficient for a maximum of 7 RNA preparation runs on the QIAcube. Multiple runs with few samples should be avoided in order to allow sufficient buffer volumes for processing the full 50 samples.

8. Disposal slots for tips and columns
9. Robotic arm
Spin columns, microcentrifuge tubes, and QIAcube plasticware

Place 2 tip racks filled with Filter-Tips 1000 µl onto the QIAcube (see Figure 13, page 34). Refill racks with tips when necessary.

**Note:** Only use 1000 µl filter-tips designed for use with the QIAcube.

Label rotor adapters and microcentrifuge tubes for each sample using a permanent pen. Open the PAXgene Shredder spin columns to be used, and cut the lids off completely using scissors (see Figure 14).

**Note:** For proper operation of the QIAcube robotic gripper, completely remove (cut off) the lids and all plastic parts connecting the lid to the PAXgene Shredder spin columns (see Figure 14). Otherwise, the robotic gripper cannot grip the spin columns properly.

Load the PAXgene RNA spin column, PAXgene Shredder spin column (without lid), and labeled microcentrifuge tube into the appropriate positions in each labeled rotor adapter as shown in Table 4 and Figure 15 (page 36).

**Note:** Make sure that the spin column and microcentrifuge tube lids are pushed all the way down to the bottom of the slots at the edge of the rotor adapter otherwise the lids will break off during centrifugation.

![Figure 14. Loading a PAXgene Shredder spin column.](image)

The PAXgene Shredder spin column is loaded into the middle position of the rotor adapter. Cut off the lid before loading the column.

* Use the microcentrifuge tubes (1.5 ml) included in the PAXgene Blood RNA Kit.

Figure 15. Positions in the rotor adapter. The rotor adapter has three tube positions (1–3) and three lid positions (L1–L3).

Loading the centrifuge

Load the assembled rotor adapters into the centrifuge buckets as shown in Figure 16 (page 37).

Note: If processing fewer than 12 samples, make sure to load the centrifuge rotor balanced radially (see Figure 17, page 38). All centrifuge buckets must be mounted before starting a protocol run, even if fewer than 12 samples are to be processed. A single (one) sample or 11 samples cannot be processed.
Figure 16. **Loading the centrifuge.** Load the assembled rotor adapters into the centrifuge buckets.
Figure 17. **Loading the centrifuge and shaker.** Centrifuge and shaker positions are shown for processing from two (2 samples) to ten (10 samples) samples. One or 11 samples cannot be processed.
Processing tubes

Remove any processing tubes left in the microcentrifuge tube slots from previous runs (see Figure 13, page 34). Fill 3 processing tubes with the amount of reagents given in Table 5, according to the number of samples in the run.

For DNase I incubation mix, pipet the indicated volume of DNA digestion buffer into a processing tube, and add the indicated volume of DNase I stock solution. Mix by gently pipetting the complete mixture up and down 3 times using a 1000 µl pipet tip.

Use the 2 ml processing tubes included in the PAXgene Blood RNA Kit. Label the tubes clearly with reagent names and place them into the appropriate position in the microcentrifuge tube slots, as indicated in Table 6 (page 40).

Note: DNase I is especially sensitive to physical denaturation. Mix only by pipetting, using wide-bore pipet tips to reduce shearing. Do not vortex.

Note: Be sure to only pipet the required volume as indicated in Table 5.

* Use the 2 ml processing tubes included in the PAXgene Blood RNA Kit.

Important points before starting

- Make sure that the kit box is intact and undamaged, and that buffers have not leaked. Do not use a kit that has been damaged.
- When using a pipet, ensure that it is set to the correct volume, and that liquid is carefully and completely aspirated and dispensed.
- To avoid transferring samples to the wrong tube or spin column, ensure that all tubes and spin columns are properly labeled using a permanent pen. Label the lid and the body of each tube. For spin columns, label the body of its processing tube. Close each tube or spin column after liquid is transferred to it.
- Spillages of samples and buffers during the procedure may reduce the yield and purity of RNA.
- Unless otherwise indicated, all steps of this protocol, including centrifugation steps, should be carried out at room temperature (15–25°C).

Because of the sensitivity of nucleic acid amplification technologies, the following precautions are necessary when handling samples to avoid cross-contamination:

- Carefully pipet the sample into the spin column without moistening the rim of the column.
- Always change pipet tips between liquid transfers. Use aerosol-barrier pipet tips.
- Avoid touching the spin column membrane with the pipet tip.
- After vortexing or heating a microcentrifuge tube, briefly centrifuge it to remove drops from the inside of the lid.
- Wear gloves throughout the entire procedure. In case of contact between gloves and sample, change gloves immediately.
- Close the spin column before placing it in the microcentrifuge. Centrifuge as described in the procedure.
- Open only one spin column at a time, and take care to avoid generating aerosols.
For efficient parallel processing of multiple samples, fill a rack with processing tubes to which the spin columns can be transferred after centrifugation. Discard the used processing tubes containing flow-through, and place the new processing tubes containing spin columns directly in the microcentrifuge.

**Things to do before starting**

- Blood must be collected in PAXgene Blood RNA Tubes according to the instructions in the *PAXgene Blood RNA Tube Product Circular*. If necessary, see Appendix C (page 58) for recommendations on handling PAXgene Blood RNA Tubes.

- Ensure that the PAXgene Blood RNA Tubes are incubated for at least 2 hours at room temperature after blood collection to ensure complete lysis of blood cells. Incubation of the PAXgene Blood RNA Tube overnight may increase yields. If the PAXgene Blood RNA Tube was stored at 2–8°C, –20°C or –70°C after blood collection, first equilibrate it to room temperature, and then store it at room temperature for 2 hours before starting the procedure.

- Read the safety information on page 7.

- Read the guidelines on handling RNA (Appendix A, page 55).

- Ensure that instruments, such as pipets and the shaker–incubator, have been checked and calibrated regularly according to the manufacturer’s recommendations.

- A shaker–incubator is required in steps 5 and 20. Set the temperature of the shaker–incubator to 55°C.

- Buffer BR2 may form a precipitate upon storage. If necessary, warm to 37°C to dissolve.

- Buffer BR4 is supplied as a concentrate. Before using for the first time, add 4 volumes of ethanol (96–100%, purity grade p.a.) as indicated on the bottle to obtain a working solution.

- If using the RNase-Free DNase Set for the first time, prepare DNase I stock solution. Dissolve the solid DNase I (1500 Kunitz units)* in 550 µl of the RNase-free water provided with the set. Take care that no DNase I is lost when opening the vial. Do not vortex the reconstituted DNase I. DNase I is especially sensitive to physical denaturation. Mixing should only be carried out by gently inverting the tube.

---

*Kunitz units are the commonly used units for measuring DNase I, defined as the amount of DNase I that causes an increase in A_{260} of 0.001 per minute per milliliter at 25°C, pH 5.0, with highly polymerized DNA as the substrate (Kunitz, M. (1950) J. Gen. Physiol. 33, 349 and 363).*
Current data shows that reconstituted DNase I can be stored at 2–8°C for up to 6 weeks. For long-term storage of DNase I, remove the stock solution from the glass vial, divide it into single-use aliquots (use the 1.5 ml microcentrifuge tubes supplied with the kit; there are enough for 5 aliquots), and store at −20°C for up to 9 months. Thawed aliquots can be stored at 2–8°C for up to 6 weeks. Do not refreeze the aliquots after thawing.

When reconstituting and aliquoting DNase I, ensure that you follow the guidelines for handling RNA (Appendix A, page 55).

**Procedure**

1. **Centrifuge the PAXgene Blood RNA Tube for 10 minutes at 3000–5000 x g using a swing-out rotor.**
   
   **Note:** Ensure that the blood sample has been incubated in the PAXgene Blood RNA Tube for a minimum of 2 hours at room temperature (15–25°C), in order to achieve complete lysis of blood cells.

   **Note:** The rotor must contain tube adapters for round-bottom tubes. If other types of tube adapter are used, the tubes may break during centrifugation.

2. **Remove the supernatant by decanting or pipetting. Add 4 ml RNase-free water to the pellet, and close the tube using a fresh secondary BD Hemogard closure (supplied with the kit).**

   If the supernatant is decanted, take care not to disturb the pellet, and dry the rim of the tube with a clean paper towel.

3. **Vortex until the pellet is visibly dissolved, and centrifuge for 10 minutes at 3000–5000 x g using a swing-out rotor. Remove and discard the entire supernatant.**

   Small debris remaining in the supernatant after vortexing but before centrifugation will not affect the procedure.

   **Note:** Incomplete removal of the supernatant will inhibit lysis and dilute the lysate, and therefore affect the conditions for binding RNA to the PAXgene membrane.

4. **Add 350 µl Buffer BR1, and vortex until the pellet is visibly dissolved.**
5. Pipet the sample into a 1.5 ml microcentrifuge tube. Add 300 µl Buffer BR2 and 40 µl proteinase K. Mix by vortexing for 5 seconds, and incubate for 10 minutes at 55°C using a shaker–incubator at 400–1400 rpm. After incubation, set the temperature of the shaker–incubator to 65°C (for step 20).

Note: Do not mix Buffer BR2 and proteinase K together before adding them to the sample.

6. Pipet the lysate directly into a PAXgene Shredder spin column (lilac) placed in a 2 ml processing tube, and centrifuge for 3 minutes at maximum speed (but not to exceed 20,000 x g).

Note: Carefully pipet the lysate into the spin column and visually check that the lysate is completely transferred to the spin column.

To prevent damage to columns and tubes, do not exceed 20,000 x g.

Note: Some samples may flow through the PAXgene Shredder spin column without centrifugation. This is due to low viscosity of some samples and should not be taken as an indication of product failure.

7. Carefully transfer the entire supernatant of the flow-through fraction to a fresh 1.5 ml microcentrifuge tube without disturbing the pellet in the processing tube.

8. Add 350 µl ethanol (96–100%, purity grade p.a.). Mix by vortexing, and centrifuge briefly (1–2 seconds at 500–1000 x g) to remove drops from the inside of the tube lid.

Note: The length of the centrifugation must not exceed 1–2 seconds, as this may result in pelleting of nucleic acids and reduced yields of total RNA.

9. Pipet 700 µl sample into the PAXgene RNA spin column (red) placed in a 2 ml processing tube, and centrifuge for 1 minutes at 8000–20,000 x g. Place the spin column in a new 2 ml processing tube, and discard the old processing tube containing flow-through.

10. Pipet the remaining sample into the PAXgene RNA spin column, and centrifuge for 1 minutes at 8000–20,000 x g. Place the spin column in a new 2 ml processing tube, and discard the old processing tube containing flow-through.

Note: Carefully pipet the sample into the spin column and visually check that the sample is completely transferred to the spin column.

11. Pipet 350 µl Buffer BR3 into the PAXgene RNA spin column. Centrifuge for 1 minute at 8000–20,000 x g. Place the spin column in a new 2 ml processing tube, and discard the old processing tube containing flow-through.
12. Add 10 µl DNase I stock solution to 70 µl Buffer RDD in a 1.5 ml microcentrifuge tube. Mix by gently flicking the tube, and centrifuge briefly to collect residual liquid from the sides of the tube.

If processing, for example, 10 samples, add 100 µl DNase I stock solution to 700 µl Buffer RDD. Use the 1.5 ml microcentrifuge tubes supplied with the kit.

**Note:** DNase I is especially sensitive to physical denaturation. Mixing should only be carried out by gently flicking the tube. Do not vortex.

13. Pipet the DNase I incubation mix (80 µl) directly onto the PAXgene RNA spin column membrane, and place on the benchtop (20–30°C) for 15 minutes.

**Note:** Ensure that the DNase I incubation mix is placed directly onto the membrane. DNase digestion will be incomplete if part of the mix is applied to and remains on the walls or the O-ring of the spin column.

14. Pipet 350 µl Buffer BR3 into the PAXgene RNA spin column, and centrifuge for 1 minute at 8000–20,000 x g. Place the spin column in a new 2 ml processing tube, and discard the old processing tube containing flow-through.

15. Pipet 500 µl Buffer BR4 into the PAXgene RNA spin column, and centrifuge for 1 minute at 8000–20,000 x g. Place the spin column in a new 2 ml processing tube, and discard the old processing tube containing flow-through.

**Note:** Buffer BR4 is supplied as a concentrate. Ensure that ethanol is added to Buffer BR4 before use (see “Things to do before starting”, page 42).

16. Add another 500 µl Buffer BR4 to the PAXgene RNA spin column. Centrifuge for 3 minutes at 8000–20,000 x g.

17. Discard the processing tube containing the flow-through, and place the PAXgene RNA spin column in a new 2 ml processing tube. Centrifuge for 1 minute at 8000–20,000 x g.

18. Discard the processing tube containing the flow-through. Place the PAXgene RNA spin column in a 1.5 ml microcentrifuge tube, and pipet 40 µl Buffer BR5 directly onto the PAXgene RNA spin column membrane. Centrifuge for 1 minute at 8000–20,000 x g to elute the RNA.

It is important to wet the entire membrane with Buffer BR5 in order to achieve maximum elution efficiency.

19. Repeat the elution step (step 18) as described, using 40 µl Buffer BR5 and the same microcentrifuge tube.
20. **Incubate the eluate for 5 minutes at 65°C in the shaker-incubator (from step 5) without shaking. After incubation, chill immediately on ice.**

This incubation at 65°C denatures the RNA for downstream applications. Do not exceed the incubation time or temperature.

21. **If the RNA samples will not be used immediately, store at –20°C or –70°C.**

Since the RNA remains denatured after repeated freezing and thawing, it is not necessary to repeat the incubation at 65°C. If using the RNA samples in a diagnostic assay, follow the instructions supplied by the manufacturer.

For accurate quantification of RNA by absorbance at 260 nm, we recommend diluting samples with 10 mM Tris-HCl, pH 7.5.* Diluting the sample in RNase-free water may lead to inaccurately low values.

Zero the spectrophotometer using a blank consisting of the same proportion Buffer BR5 and Tris-HCl buffer as in the samples to be measured. Buffer BR5 has high absorbance at 220 nm, which can lead to high background absorbance levels if the spectrophotometer is not properly zeroed.

**Note:** For quantification in Tris-HCl buffer, use the relationship $A_{260} = 1 \Rightarrow 44 \, \mu g/ml$. See Appendix B, page 56.

---

* When working with chemicals, always wear a suitable lab coat, disposable gloves, and protective goggles. For more information, consult the appropriate safety data sheets (SDSs), available from the product supplier.
Protocol: Automated Purification of Total RNA from Human Whole Blood Collected into PAXgene Blood RNA Tubes

Important points before starting

- Make sure that the kit box is intact and undamaged, and that buffers have not leaked. Do not use a kit that has been damaged.
- When using a pipet, ensure that it is set to the correct volume, and that liquid is carefully and completely aspirated and dispensed.
- To avoid transferring samples to the wrong tubes and plastic consumables, ensure that all processing tubes, microcentrifuge tubes, and rotor adapters are properly labeled using a permanent pen. Label the lid and the body of each microcentrifuge tube, the body of each processing tube, and the outer wall of each rotor adapter.
- Spillages of samples and buffers during the procedure may reduce the yield and purity of RNA.
- Unless otherwise indicated, all steps of this protocol, including centrifugation steps, should be carried out at room temperature (15–25°C). Because of the sensitivity of nucleic acid amplification technologies, the following precautions are necessary when handling samples to avoid cross-contamination:
  - Carefully pipet the sample into the processing tube, on the bottom of the tube without moistening the rim of the tube.
  - Always change pipet tips between liquid transfers. Use aerosol-barrier pipet tips.
  - Avoid touching the spin column membrane with the pipet tip.
  - After vortexing or heating a microcentrifuge tube, briefly centrifuge it to remove drops from the inside of the lid.
  - Wear gloves throughout the entire procedure. In case of contact between gloves and sample, change gloves immediately.

Things to do before starting

- Blood must be collected in PAXgene Blood RNA Tubes according to the instructions in the PAXgene Blood RNA Tube Product Circular. If necessary, see Appendix C (page 58) for recommendations on handling PAXgene Blood RNA Tubes.
Ensure that the PAXgene Blood RNA Tubes are incubated for at least 2 hours at room temperature after blood collection to ensure complete lysis of blood cells. Incubation of the PAXgene Blood RNA Tube overnight may increase yields. If the PAXgene Blood RNA Tube was stored at 2–8°C, –20°C or –70°C after blood collection, first equilibrate it to room temperature, and then store it at room temperature for 2 hours before starting the procedure.

Read the safety information on page 7.

Read “Important Notes”, page 31.

Read the guidelines on handling RNA (Appendix A, page 55).

Read the QIAcube User Manual and any additional information supplied with the QIAcube, paying careful attention to the safety information.

Ensure that instruments, such as pipets and the QIAcube, have been checked and calibrated regularly according to the manufacturer’s recommendations.

Buffer BR2 may form a precipitate upon storage. If necessary, warm to 37°C to dissolve.

Buffer BR4 is supplied as a concentrate. Before using for the first time, add 4 volumes of ethanol (96–100%, purity grade p.a.) as indicated on the bottle to obtain a working solution.

If using the RNase-Free DNase Set for the first time, prepare DNase I stock solution. Dissolve the solid DNase I (1500 Kunitz units)* in 550 µl of the RNase-free water provided with the set. Take care that no DNase I is lost when opening the vial. Do not vortex the reconstituted DNase I. DNase I is especially sensitive to physical denaturation. Mixing should only be carried out by gently inverting the tube.

Current data shows that reconstituted DNase I can be stored at 2–8°C for up to 6 weeks. For long-term storage of DNase I, remove the stock solution from the glass vial, divide it into single-use aliquots (use the 1.5 ml microcentrifuge tubes supplied with the kit; there are enough for 5 aliquots), and store at –20°C for up to 9 months. Thawed aliquots can be stored at 2–8°C for up to 6 weeks. Do not refreeze the aliquots after thawing.

* Kunitz units are the commonly used units for measuring DNase I, defined as the amount of DNase I that causes an increase in $A_{260}$ of 0.001 per minute per milliliter at 25°C, pH 5.0, with highly polymerized DNA as the substrate (Kunitz, M. (1950) J. Gen. Physiol. 33, 349 and 363).
When reconstituting and aliquoting DNase I, ensure that you follow the guidelines for handling RNA (Appendix A, page 55).

Install the correct shaker adapter (included with the QIAcube; use the adapter for 2 ml safe-lock tubes, marked with a “2”), and place the shaker rack on top of the adapter.

Check the waste drawer and empty it if necessary.

Procedure

1. Close the QIAcube door, and switch on the QIAcube with the power switch (see Figure 11 page 32).
   A beeper sounds and the startup screen appears. The instrument automatically performs initialization tests.

2. Open the QIAcube door, and load the necessary reagents and plasticware into the QIAcube. See “Loading the QIAcube”, page 32.
   To save time, loading can be performed during one or both of the following 10-minute centrifugation steps (steps 3 and 5).

3. Centrifuge the PAXgene Blood RNA Tube for 10 minutes at 3000–5000 x \(g\) using a swing-out rotor.
   **Note**: Ensure that the blood sample has been incubated in the PAXgene Blood RNA Tube for a minimum of 2 hours at room temperature (15–25°C), in order to achieve complete lysis of blood cells.

   **Note**: The rotor must contain tube adapters for round-bottom tubes. If other types of tube adapter are used, the tubes may break during centrifugation.

4. Remove the supernatant by decanting or pipetting. Add 4 ml RNase-free water to the pellet, and close the tube using a fresh secondary BD Hemogard closure (supplied with the kit).
   If the supernatant is decanted, take care not to disturb the pellet, and dry the rim of the tube with a clean paper towel.

5. Vortex until the pellet is visibly dissolved, and centrifuge for 10 minutes at 3000–5000 x \(g\) using a swing-out rotor. Remove and discard the entire supernatant.
   Small debris remaining in the supernatant after vortexing but before centrifugation will not affect the procedure.

   **Note**: Incomplete removal of the supernatant will inhibit lysis and dilute the lysate, and therefore affect the conditions for binding RNA to the PAXgene membrane.
6. Add 350 µl Buffer BR1, and vortex until the pellet is visibly dissolved.
7. Pipet the sample into a 2 ml processing tube.
    Note: Use the 2 ml processing tubes included in the PAXgene Blood RNA Kit.
8. Load the open 2 ml processing tubes containing sample into the QIAcube shaker (see Figure 13, page 34). The sample positions are numbered for ease of loading. Insert shaker rack plugs (included with the QIAcube) into the slots at the edge of the shaker rack next to each processing tube. This enables detection of samples during the load check.
    Note: Make sure that the correct shaker adapter (Shaker Adapter, 2 ml, safe-lock tubes, marked with a “2”, included with the QIAcube) is installed.
    Note: If processing fewer than 12 samples, make sure to load the shaker rack as shown in Figure 17, page 38. One or 11 samples cannot be processed.
9. Close the QIAcube instrument door (see Figure 11, page 32).
10. Select the “PAXgene Blood RNA Part A” protocol, and start the protocol.
    Follow the instructions given on the QIAcube touchscreen.
    Note: Make sure that both program parts (part A and part B) are installed on the QIAcube instrument (see “Installing protocols on the QIAcube”, page 31).
    Note: The QIAcube will perform load checks for samples, tips, rotor adapters, and reagent bottles.
11. After the “PAXgene Blood RNA Part A” protocol is finished, open the QIAcube instrument door (see Figure 11, page 32). Remove and discard the PAXgene RNA spin columns from rotor adapters and the empty processing tubes from the shaker.
    Note: During the run, spin columns are transferred from the rotor adapter position 1 (lid position L1) to rotor adapter position 3 (lid position L2) by the instrument (see Figure 15, page 36).
12. Close the lids of all 1.5 ml microcentrifuge tubes containing the purified RNA in the rotor adapters (position 3, lid position L3, see Figure 15, page 36). Transfer the 1.5 ml microcentrifuge tubes onto the QIAcube shaker adapter (see Figure 13, page 34).
13. Close the QIAcube instrument door (see Figure 11, page 32).
14. Select the “PAXgene Blood RNA Part B” protocol, and start the protocol.

Follow the instructions given on the QIAcube touchscreen.

**Note:** This program incubates the samples at 65°C and denatures the RNA for downstream applications. Even if the downstream application includes a heat denaturation step, do not omit this step. Sufficient RNA denaturation is essential for maximum efficiency in downstream applications.

15. After the “PAXgene Blood RNA Part B” program is finished, open the QIAcube instrument door (see Figure 11, page 32). Immediately place the microcentrifuge tubes containing the purified RNA on ice.

**WARNING:** Hot surface. The shaker can reach temperatures of up to 70°C (158°F). Avoid touching it when it is hot.

**Note:** Do not let the purified RNA remain in the QIAcube. Since the samples are not cooled, the purified RNA can be degraded. Unattended overnight sample preparation runs are therefore not recommended.

16. If the RNA samples will not be used immediately, store at –20°C or –70°C.

Since the RNA remains denatured after repeated freezing and thawing, it is not necessary to repeat the heat incubation protocol (“PAXgene Blood RNA Part B”). If using the RNA samples in a diagnostic assay, follow the instructions supplied by the manufacturer.

For accurate quantification of RNA by absorbance at 260 nm, we recommend diluting samples with 10 mM Tris-HCl, pH 7.5.* Diluting the sample in RNase-free water may lead to inaccurately low values.

Zero the spectrophotometer using a blank consisting of the same proportion Buffer BR5 and Tris-HCl buffer as in the samples to be measured. Buffer BR5 has high absorbance at 220 nm, which can lead to high background absorbance levels if the spectrophotometer is not properly zeroed.

**Note:** For quantification in Tris-HCl buffer, use the relationship

\[ A_{260} = 1 =\Rightarrow 44 \mu\text{g/ml} \]. See Appendix B, page 56.

---

* When working with chemicals, always wear a suitable lab coat, disposable gloves, and protective goggles. For more information, consult the appropriate safety data sheets (SDSs), available from the product supplier.
17. Remove the reagent bottle rack from QIAcube worktable (see Figure 13, page 34), and close all bottles with the appropriately labeled lids. Buffer in bottles can be stored at room temperature (15–25°C) for up to 3 months. Remove and discard remaining reagents in the processing tubes in the QIAcube microcentrifuge tube slots (see Figure 13, page 34). Remove and discard rotor adapters from the centrifuge (see Figure 13, page 34). Empty the QIAcube waste drawer (see Figure 11, page 32). Close the QIAcube instrument door, and switch off the instrument with the power switch (see Figure 11, page 32).
Troubleshooting Guide

This troubleshooting guide may be helpful in solving any problems that may arise. For more information, see also the Frequently Asked Questions page at our Technical Support Center: www.qiagen.com/FAQ/FAQList.aspx. The scientists in QIAGEN Technical Services are always happy to answer any questions you may have about either the information and protocols in this handbook or sample and assay technologies (for contact information, see page 63 or visit www.qiagen.com).

Comments and suggestions

RNA degraded

| RNase contamination | Be careful not to introduce any RNases into the reagents during the procedure or later handling (see Appendix A, page 55). |

Low RNA yield

| a) Less than 2.5 ml blood collected in PAXgene Blood RNA Tube | Ensure that 2.5 ml blood is collected in the PAXgene Blood RNA Tube (see PAXgene Blood RNA Tube Product Circular). |
| b) RNA concentration measured in water | RNA concentration must be measured in 10 mM Tris-HCl, pH 7.5* for accurate quantification (see Appendix B, page 56). |
| c) Cell debris transferred to PAXgene RNA spin column in steps 9 and 10 of the manual protocol | Avoid transferring large particles when pipetting the supernatant in step 7 of the manual protocol (transfer of small debris will not affect the procedure). |
| d) Supernatant not completely removed in step 3 | Ensure the entire supernatant is removed. If the supernatant is decanted, remove drops from the rim of the tube by dabbing onto a paper towel. Take appropriate precautions to prevent cross-contamination. |

* When working with chemicals, always wear a suitable lab coat, disposable gloves, and protective goggles. For more information, consult the appropriate safety data sheets (SDSs), available from the product supplier.
### Comments and suggestions

| e) After collection into the PAXgene Blood RNA Tube, blood is incubated for less than 2 hours | Incubate blood in the PAXgene Blood RNA Tube for at least 2 hours after collection. |

**Low $A_{260}/A_{280}$ value**

| a) Water used to dilute RNA for $A_{260}/A_{280}$ measurement | Use 10 mM Tris-HCl, pH 7.5 to dilute RNA before measuring purity* (see Appendix B, page 56). |
| b) Spectrophotometer not properly zeroed | Zero the spectrophotometer using a blank consisting of the same proportion Buffer BR5 and 10 mM Tris-HCl, pH 7.5, as in the samples to be measured. Buffer BR5 has high absorbance at 220 nm, which can lead to high background absorbance levels if the spectrophotometer is not properly zeroed. |

**Instrument malfunction**

| QIAcube not operated properly | Read the QIAcube User Manual, paying careful attention to the Troubleshooting section. Make sure that the QIAcube is properly maintained, as described in the QIAcube User Manual. |

---

Appendix A: General Remarks on Handling RNA

Handling RNA

Ribonucleases (RNases) are very stable and active enzymes that generally do not require cofactors to function. Since RNases are difficult to inactivate and even minute amounts are sufficient to degrade RNA, do not use any plasticware or glassware without first eliminating possible RNase contamination. Great care should be taken to avoid inadvertently introducing RNases into the RNA sample during or after the purification procedure. In order to create and maintain an RNase-free environment, precautions must be taken during pretreatment and use of disposable and non-disposable vessels and solutions while working with RNA.

General handling

Proper microbiological, aseptic technique should always be used when working with RNA. Hands and dust particles carry bacteria and molds and are the most common sources of RNase contamination. Always wear latex or vinyl gloves while handling reagents and RNA samples to prevent RNase contamination from the surface of the skin or from dusty laboratory equipment. Change gloves frequently and keep tubes closed whenever possible. Keep purified RNA on ice when aliquots are pipetted for downstream applications.

Appendix B: Quantification and Determination of Quality of Total RNA

Quantification of RNA

The concentration of RNA should be determined by measuring the absorbance at 260 nm ($A_{260}$) in a spectrophotometer. To ensure significance, readings should be in the linear range of the spectrophotometer. An absorbance of 1 unit at 260 nm corresponds to 44 µg of RNA per ml ($A_{260} = 1 \Rightarrow 44 \, \mu g/ml$). This relation is valid only for measurements in 10 mM Tris-HCl,*, pH 7.5. Therefore, if it is necessary to dilute the RNA sample and this should be done in 10 mM Tris-HCl. As discussed below (see “Purity of RNA,” page 57), the ratio between the absorbance values at 260 and 280 nm gives an estimate of RNA purity.

When measuring RNA samples, be certain that cuvettes are RNase-free. Zero the spectrophotometer using a blank consisting of the same proportion Buffer BR5 and Tris-HCl buffer as in the samples to be measured. Buffer BR5 has high absorbance at 220 nm, which can lead to high background absorbance levels if the spectrophotometer is not properly zeroed.

An example of the calculation involved in RNA quantification is shown below:

- **Volume of RNA sample** = 80 µl
- **Dilution** = 10 µl of RNA sample + 140 µl 10 mM Tris-HCl, pH 7.5 (1/15 dilution)
- **Measure absorbance of diluted sample in a cuvette (RNase-free).**
  - $A_{260} = 0.3$
- **Concentration of RNA sample** = $44 \times A_{260} \times \text{dilution factor}$
  - $= 44 \times 0.3 \times 15$
  - $= 198 \, \mu g/ml$
- **Total yield** = concentration x volume of sample in milliliters
  - $= 198 \, \mu g/ml \times 0.08 \, ml$
  - $= 15.8 \, \mu g \, RNA$

*When working with chemicals, always wear a suitable lab coat, disposable gloves, and protective goggles. For more information, consult the appropriate safety data sheets (SDSs), available from the product supplier.*
Purity of RNA

The ratio of the readings at 260 nm and 280 nm ($A_{260}/A_{280}$) provides an estimate of the purity of RNA with respect to contaminants that absorb in the UV, such as protein. However, the $A_{260}/A_{280}$ ratio is influenced considerably by pH. Lower pH results in a lower $A_{260}/A_{280}$ ratio and reduced sensitivity to protein contamination.* For accurate values, we recommend measuring absorbance in 10 mM Tris-HCl, pH 7.5. Pure RNA has an $A_{260}/A_{280}$ ratio of 1.8–2.2 in 10 mM Tris-HCl, pH 7.5.

Zero the spectrophotometer using a blank consisting of the same proportion Buffer BR5 and Tris-HCl buffer as in the samples to be measured. Buffer BR5 has high absorbance at 220 nm, which can lead to high background absorbance levels if the spectrophotometer is not properly zeroed.

Appendix C: Handling PAXgene Blood RNA Tubes

The following recommendations from BD may be helpful when handling PAXgene Blood RNA Tubes. See the PAXgene Blood RNA Tube Product Circular for more information about PAXgene Blood RNA Tubes.

Instructions for removal of BD Hemogard Closure

1. Grasp the PAXgene Blood RNA Tube with one hand, placing the thumb under the BD Hemogard closure. (For added stability, place arm on solid surface.) With the other hand, twist the BD Hemogard closure while simultaneously pushing up with the thumb of the other hand ONLY UNTIL THE TUBE STOPPER IS LOOSENED.

2. Move thumb away before lifting closure. DO NOT use thumb to push closure off tube. Caution: If the tube contains blood, an exposure hazard exists. To help prevent injury during closure removal, it is important that the thumb used to push upward on the closure be removed from contact with the tube as soon as the BD Hemogard closure is loosened.

3. Lift closure off tube. In the unlikely event of the plastic shield separating from the rubber stopper, DO NOT REASSEMBLE CLOSURE. Carefully remove rubber stopper from tube.

Instructions for insertion of Secondary BD Hemogard Closure

1. Replace closure over tube.

2. Twist and push down firmly until stopper is fully reseated. Complete reinsertion of the stopper is necessary for the closure to remain securely on the tube during handling.
